On the other hand, the `getInfo` method of `FileInfo` returns an instance of the `FileInfo` ctor (which contains an `e FileSystemInfo` field). So, the result is a blend of both the type of the returned file object (the `FileInfo` object) and the type of the file object the method was actually called on (`FileStream`, `FileStreamSource`, `FileStreamSourceLoader` etc.). The eventual target of the query is a `FileSystemInfo` object, so no actual comparison is required. In your example, calling `getInfo(x)` and `getInfo(y)` - or even `getInfo()` and `getInfo()` - will return the same results. A: The `FileInfo(x)` and `FileInfo(y)` overloads have same filetype. This is why they return the same type. Also, they will return the same hash. While the `FileInfo(x).GetHash()` and `FileInfo(y).GetHash()` overloads will return different hash. This means they are different files. In the implementation of the `GetHash()` method there is a switch. But, as I said above they will return the same type of filetype and return the same hash. Q: Call function in asp page from jquery I want to call a function in ASP page from jQuery. I saw many examples using: `this.Page.ClientScript.RegisterStartupScript(this.GetType(), "text", "showmessage(333);", true);` or ASP.NET: How to call a javascript function from a textbox onclick event using ASP.NET But I want to call a function like `window.load()` or `init()` this function is in asp page A: The best way is to call the function directly instead of calling it on a page. The present invention relates to a new and distinct cultivar of *Rudbeckia* plant botanically known as *Rudbeckia hirta* and hereinafter referred to by the cultivar name 'Touch of Gold'. The new *Rudbeckia* cultivar is the product of a planned breeding program conducted by the inventor in Enkhuizen, Netherlands. The objective of this breeding program is to create new *Rudbeckia* cultivars with upright- and rounded-growing habits with early and freely flowering habit and with attractive inflorescence coloration. 'Touch of Gold'

A pedestrian network using a photoplethysmographic sensor for infra-red radiation. A pedestrian network using an infra-red radiation-type sensor for traffic-flow monitoring of walking pedestrians, is presented. Infra-red radiation was used, because it can be transmitted through glass and a transparent plastic shield. The radiation is detected at the inner surface of the transparent shield by a photodetector. In this paper, a photoplethysmographic (PPG) sensor based on the principle of infra-red radiation transmittance has been developed. The temporal derivative of the total response integral of the PPG sensor is proportional to the blood volume change during arterial pulse waves. A computer processing algorithm was developed for the photoplethysmographic system to estimate the systolic blood pressure and heart rate of a walking pedestrian. The systolic blood pressure and the heart rate of a walking pedestrian have been measured at 3e33713323
